

Research Phase Report Employee Performance Tracking System

Project Name	Employee Performance Tracking System
Prepared By	Anwarali Mulla
University	Vijaybhoomi University
Project Type	Web-Based Application
Research Year	2026

1. Introduction

The Employee Performance Tracking System is a web-based platform designed to monitor, manage, and evaluate employee work across multiple departments and job roles.

2. Market Overview & Trends

Modern organizations prefer transparent and task-focused performance systems instead of invasive employee monitoring tools. Companies now focus more on outcome-based tracking using dashboards that clearly show Assigned, Completed, and Pending work.

3. Problem Statement

Organizations struggle to maintain a centralized system for tracking employee work and evaluating performance across different departments. Manual tracking methods often result in poor visibility, delayed reporting, inaccurate evaluations, and inefficient workload management.

4. Core Objectives

- Track assigned, completed, pending, and overdue tasks.
- Provide centralized dashboards for managers and HR.
- Generate detailed work summaries and reports.
- Improve transparency and accountability.
- Support multiple departments and job roles.

5. Essential Features

- Task assignment and task management
- Assigned vs Completed vs Remaining dashboards
- Performance analytics and reports
- Work summary and history tracking
- Notifications and alerts
- Role-based access control

6. Best Practices

Research recommends focusing on outcome-based tracking instead of invasive monitoring methods such as keystroke tracking or screenshots. Systems should remain transparent, fair, and flexible for different job roles and departments.

7. India-Specific Compliance

According to the DPDP Act 2023, organizations must clearly inform employees about what data is collected and why it is used. The project should focus only on work-related metrics and avoid unnecessary invasive monitoring.

8. Risks & Challenges

- Employee resistance if the system feels like surveillance
- Inconsistent task updates and poor data quality
- Unfair comparison between different job roles
- Workload imbalance across departments

9. Technical Insights

Research suggests beginning with task management, dashboards, and reporting systems before implementing advanced AI or machine learning features. Simple analytics and rule-based scoring systems are recommended for the initial version of the project.

10. Conclusion

The research confirms that the proposed Employee Performance Tracking System aligns with modern industry requirements and should prioritize task tracking, centralized dashboards, transparency, and fairness.
